

# Linear Algebra & Matlab

10-701/15-781, Recitation

Jan 21, 2010

Ni Lao

- Part I Some Linear Algebra
  - Might be useful to HW2 and later courses

# Basics

- We will use lower case letters for vectors, and upper case letters from matrixes. Their elements are referred by  $x_i$ ,  $A_{i,j}$ . Refer  $A$ 's column vectors as  $A_j$
- $AB$ 
  - still remember what is matrix multiplication?
- $A=A^T$ 
  - transpose and symmetric matrix
- $a \cdot b = a^T b$ ,  $\|a\|_2 = \sqrt{a^T a}$ 
  - inner product, vectors are also matrixes
- $AA^{-1}=I$ 
  - Inverse and the identity matrix
- $tr(A)=\sum A_{i,i}$ 
  - trace, and the diagonal of a matrix

# Basis and Space

- $span(x_1, x_2, x_3) = \{a_1x_1 + a_2x_2 + a_3x_3 \mid a_i \in R\}$ 
  - the span of a set of vectors is a subspace in the  $R^d$  space, assuming  $x_i$  are vectors in  $R^d$  space
- $col(A) = \{x \mid x = Ab\}$ 
  - A's column space is the span of A's column vectors
- $row(A) = \{x \mid x = A^Tb\}$ 
  - A's rows space is the span of A's rows vectors
- Basis
  - A basis B of a space V is a linearly independent subset of V that spans (or generates) V
- $e_i = (0, 0, \dots, 1, \dots, 0)$ 
  - the standard basis

# Unitary Matrix

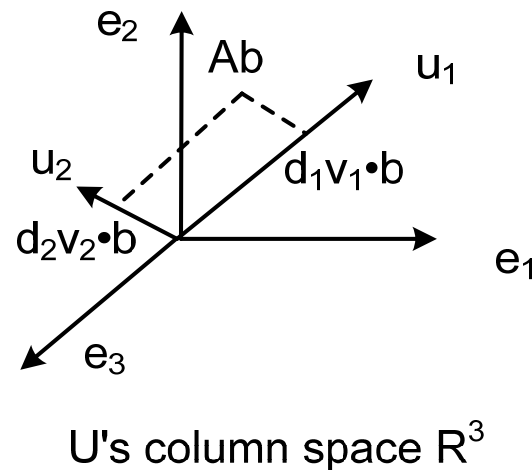

- If  $a \cdot b = 0$ ,  $\|a\|_2 \neq 0$ ,  $\|b\|_2 \neq 0$ ,
  - then  $a$  and  $b$  are orthogonal
- If  $n$ -by- $n$  matrix  $A$ ,  $A^T A = I$ 
  - then  $A$  is an unitary matrix
  - $\|A_i\|_2 = 1$  for any  $i$
  - and  $A_i \cdot A_j = 0$ , for  $i \neq j$
- *If  $A$  is unitary, then  $A^T$  is also unitary*

# Rank of a Matrix

- $\text{rank}(A)$  (the rank of a  $m$ -by- $n$  matrix  $A$ ) is
  - The maximal number of linearly independent columns
  - The maximal number of linearly independent rows
  - The dimension of  $\text{col}(A)$
  - The dimension of  $\text{row}(A)$
- If  $A$  is  $n$  by  $m$ , then
  - $\text{rank}(A) \leq \min(m, n)$
  - If  $n = \text{rank}(A)$ , then  $A$  has full row rank
  - If  $m = \text{rank}(A)$ , then  $A$  has full column rank

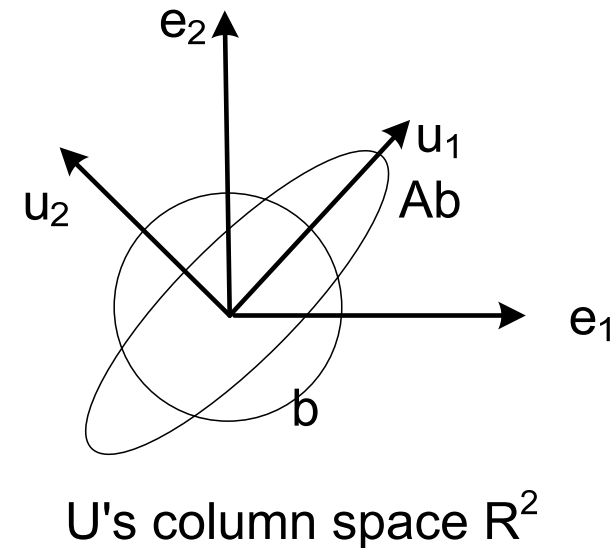

# Singular Value Decomposition (SVD)

- Any matrix  $A$  can be decompose as  $A=UDV^T$ , where
  - where  $D$  is diagonal, with  $d=\text{rank}(A)$  non-zero elements
  - $U$  and  $V$  are unitary matrices
  - The first  $d$  rows of  $U$  are orthogonal basis for  $\text{col}(A)$
  - The first  $d$  rows of  $V$  are orthogonal basis for  $\text{row}(A)$
- Re-interpreting  $Ab$ 
  - Decompose  $b$  by  $V$  basis
  - Scale it by  $\text{diag}(D)$
  - Then map it to the space spanned by  $U$  basis

# Eigen Value Decomposition

- Any symmetric matrix  $A$  can be decompose as  $A=UDU^T$ , where
  - where  $D$  is diagonal, with  $d=\text{rank}(A)$  non-zero elements
  - The first  $d$  rows of  $U$  are orthogonal basis for  $\text{col}(A)=\text{row}(A)$
- Re-interpreting  $Ab$ 
  - first stretch  $b$  along the direction of  $u_1$  by  $d_1$  times
  - Then further stretch it along the direction of  $u_2$  by  $d_2$  times

# Inverting a Low Rank Covariance Matrix

- In many applications (e.g. linear regression, Gaussian model) we need to calculate the inverse of covariance matrix  $X^T X + \lambda I$ 
  - *where each row of  $X$  is a data sample*
  - *$I$  is an identity matrix for regularization*
- If the number of feature is huge (e.g. each sample is an image, #sample  $n \ll$  #feature  $d$ )
  - then  $X$  is an very wide and short matrix
  - inverting  $X^T X + \lambda I$  becomes an problem
    - the complexity of matrix inversion is generally  $O(n^3)$
    - Matlab can comfortably solve matrix with  $d$ =thousand, but not much more than that

# Inverting a Low Rank Covariance Matrix

- With the help of SVD, we actually don't need to explicitly inverse  $X^T X + \lambda I$ 
  - Decompose  $X = UDV^T$
  - Then  $X^T X + \lambda I = VDU^T UDV^T + \lambda I = V(D^2 + \lambda I)V^T$
  - Since  $V(D^2 + \lambda I)V^T V(D^2 + \lambda I)^{-1}V^T = I$
  - We know that  $(X^T X + \lambda I)^{-1} = V(D^2 + \lambda I)^{-1}V^T$ 
    - Inverting a diagonal matrix  $D^2 + \lambda I$  is trivial

- Part II Matlab
  - Might be useful to HW2

# Matlab

- Very easy to do matrix manipulation in Matlab
- Available for installs by contacting `help+@cs.cmu.edu`
- If this is your first time using Matlab
  - Strongly suggest you go through the “Getting Started” part of Matlab help
  - Many useful basic syntax

# Making Matrix

- $A=[1\ 2\ 3; 4\ 5\ 6; 7\ 8\ 9]$
- $A=\text{ones}(m,n)$
- $A=\text{zeros}(m,n)$
- $A=\text{eye}(n)$
- $A=\text{diag}([1\ 2\ 3])$

# Referencing Matrix

- $A(i,j)$ 
  - reference a single element
- $A(i,:)$ ,  $A(:,j)$ 
  - reference a whole row/column
- $b=1:3:100$ ;  $A(b,:)$ 
  - using vector as index
- $b=\text{diag}(A)$ 
  - reference the diagonal vector

# Matrix Manipulation

- $C=A'$ ;
  - transpose
- $C=A+B$ ;  $D=A*B$ ;
- $D=A^3$ 
  - Equal to  $A*A*A$
- $x=A\b{b}$ ;  $x=b/A$ 
  - multiply the inverse of a matrix
- $D=A.*B$ ;  $D=A./B$ ;  $D=A.\B$ ;  $D=A.^3$ ;
  - Point wise multiplication/division/power

# Matrix Decomposition

- $[U, S, V] = \text{svd}(X)$
- $[V, D] = \text{eig}(A)$

- The End
- Thanks
